

Zeitschrift für Kristallographie
**International journal for structural, physical,
 and chemical aspects of crystalline materials**

The journal intends to furnish a topical review on the progress made in the field of crystallography by publishing research work from all over the world. The science of crystallography supplies indispensable fundamental information for all fields of pure and applied materials science. Its most important fields cover the geometry, chemistry, structural research and physics of crystalline materials. With unmatched accuracy and by automated procedures, the crystallographic methods afford the determination of the most complicated inorganic structures as well as organic molecular structures. The science of crystallography thus paves the way towards progress in almost all fields of materials science and also certain fields of biology and medicine.

It is the first journal in the field of crystallography which processes electronic files into short structure contributions. Therefore, quick and reliable publications of the most recent results of structural research are guaranteed.

Zeitschrift für Physikalische Chemie
**International journal of research in
 physical chemistry & chemical physics**

The journal publishes original contributions and short communications on developments in all areas of Physical Chemistry with emphasis on experimental research. No restriction to a specialized field in physical chemistry is intended.

As many modern scientists work in both disciplines – physics and chemistry - , this journal is an ideal forum for their ideas and particular needs.

Radiochimica Acta
**International journal for chemical
 aspects of nuclear science and
 technology**

Radiochimica Acta publishes original papers and review articles on all chemical aspects of nuclear science and technology. Relevant topics are: chemistry of nuclear reactions including heavy ion reactions / chemical effects of nuclear transformations (hot atom chemistry) / chemistry of the actinides and other radioelements / radiation chemistry / radioanalytical chemistry / scientific and technical applications of radionuclides / stable isotopes and nuclear methods in all fields / chemistry of the nuclear fuel cycle and chemistry of radionuclides in geomedica.

The journal is meant for scientists who are actively doing research work in either one of the above mentioned fields of nuclear and science and technology.
